PORTFOLIO / CREATIVE DEVELOPMENT

Every game starts with a touch.

I build playable ads that introduce game mechanics through interaction, bringing scenarios, code and visual feedback together in a short experience people can try before installing.

01 / 08 BUILD / BATTLE

Bowmasters

The battle starts before the first shot. This playable lets the player assemble a battle vehicle, buy upgrades and prepare for the fight. Clear controls, visible costs and changes inside the game scene take the place of a lengthy explanation.

The mechanic

Develop a battle vehicle by buying new sections and upgrades. Building connects the preparation stage to the battle scenario.

The gameplay loop

Add a section → choose an upgrade → prepare the vehicle → start the battle.

The interaction focus

The coin balance and vehicle appearance immediately show the result of a purchase. A contextual hint guides the first upgrade.

02 / 08 TACTICS / BATTLE

Battle Lines

A short tactical adventure where the next target is chosen by comparing enemy strength. Power values live inside the game scene: the player reads the options and decides who to fight. Readable choices matter more than complicated controls.

The mechanic

Choose an opponent on the game field and enter a battle using the hero's and enemies' strength values.

The gameplay loop

Compare strength → choose a target → enter the battle → continue along the path.

The interaction focus

Power values next to characters support decisions inside the scene. The camera connects the route with the nearest available targets.

Character strength

03 / 08 ACTION / SHOOTER

World War Heroes

A first-person shooter drops the player straight into a battle scene. Enemies are ahead, the weapon is already in hand, and a short hint explains the controls. Holding a touch starts shooting, keeping the path from first action to feedback direct.

The mechanic

First-person shooting controlled by holding a touch. The crosshair, health and ammunition remain in the player's field of view.

The gameplay loop

Find a target → hold to shoot → fire → move attention to the next enemy.

The interaction focus

Enemy highlighting separates targets from the environment. The weapon, crosshair and indicators support a continuous sense of action.

04 / 08 AIM / SHOOTER

Tank Sniper

This tank playable centres on one clear action: aim the cannon at a target. A 3D scene, a visible crosshair and a large hint establish the task from the first screen. A target counter makes progress readable throughout the short combat sequence.

The mechanic

Aim and fire a tank at opponents in a three-dimensional scene.

The gameplay loop

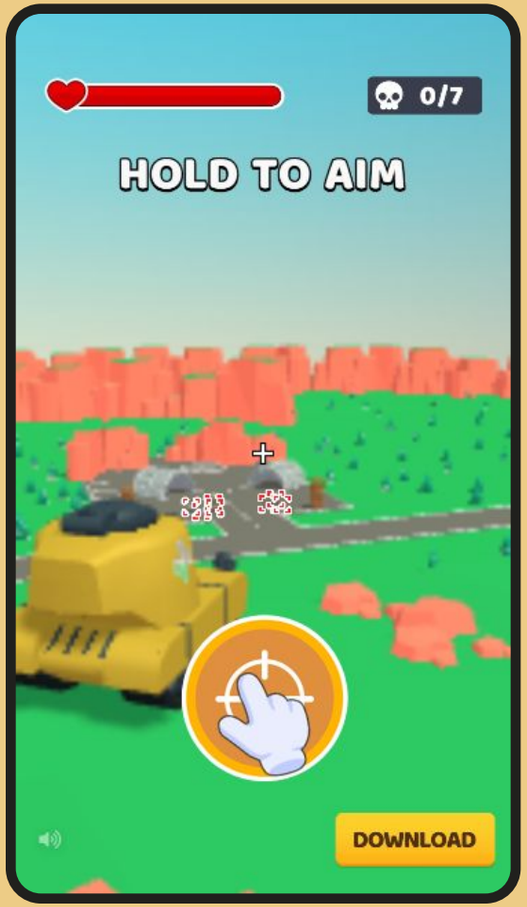

Find an opponent → aim → fire → move on to the next target.

The interaction focus

Holding a touch is tied to aiming. The crosshair, health and target counter add context without covering the playfield.

05 / 08 CONNECTION / STRATEGY

State Connect

A quiet map becomes a game system through a simple action: connect the cities. The player chooses a road option and sees a new connection appear on the map. The task and connection counter make completed progress and the next step easy to understand.

The mechanic

Connect cities into a road network by choosing different road options.

The gameplay loop

Read the task → choose a road → connect cities → expand the network.

The interaction focus

A new road appears directly on the map. Coloured nodes, connecting lines and the task counter work together to show the network changing.

06 / 08 HARVEST / RESOURCE COLLECTION

Zombie Miner: Harvest

A Zombie Miner resource-collection scenario from the Little Farm Story build. The player controls a character with a circular saw and clears a field of gold. Collecting resources changes the scene itself: a dense field becomes a travelled path while the gold counter grows.

The mechanic

Move a character with a virtual joystick and collect resources using the tool in front of them.

The gameplay loop

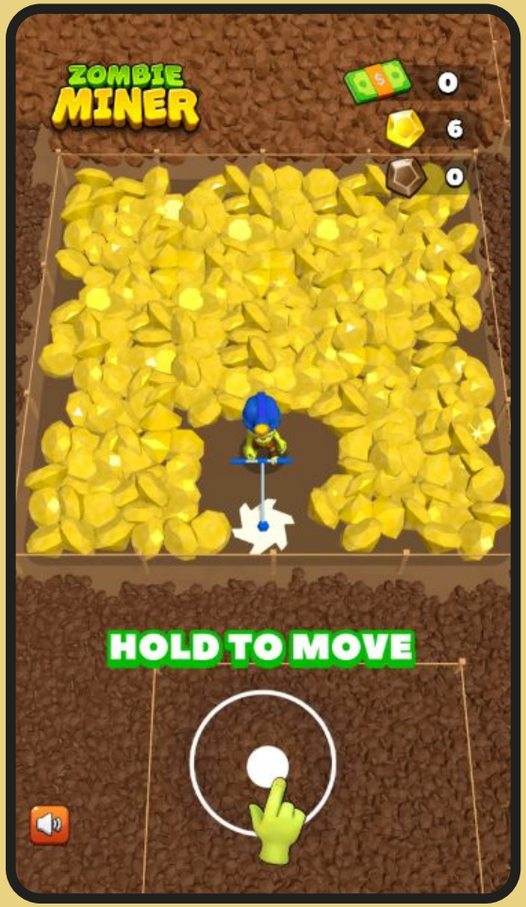

Choose a direction → clear a section → collect gold → continue along the route.

The interaction focus

Resource fragments, cleared space and the growing counter show the result of movement together. A contextual hint introduces hold-to-move controls.

07 / 08 RESOURCES / MULTIPLIERS

Zombie Miner: Multipliers

A different Zombie Miner scenario combines resource collection in a 3D space with multiplier gates and a selling area. The player controls a harvesting vehicle, chooses a path between crystals and reads the points that continue the gameplay cycle. One control scheme connects movement, harvesting and progression.

The mechanic

Drive a harvesting vehicle through a resource field containing multiplier gates and a separate selling area.

The gameplay loop

Collect resources → choose a route through a multiplier → deliver the haul to the selling area → continue harvesting.

The interaction focus

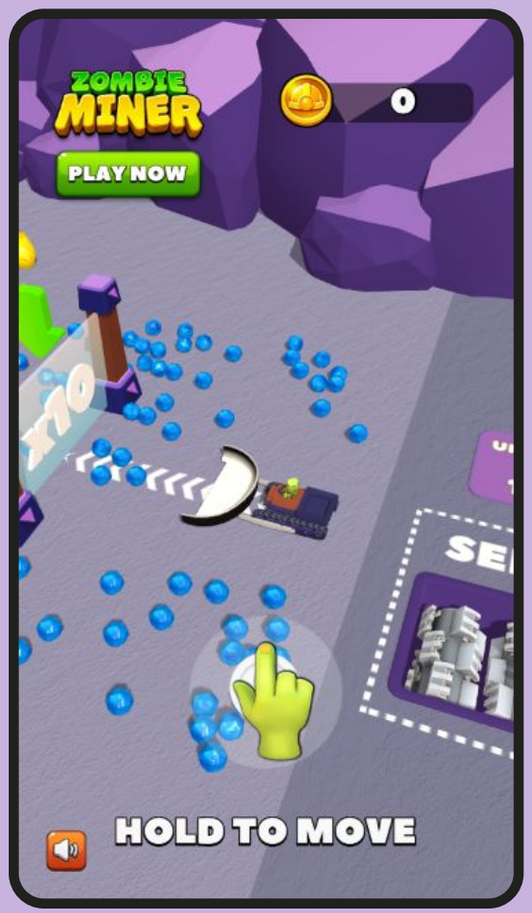

The camera follows the vehicle while ground markers help communicate the route. Crystals, gates and the selling area use distinct shapes and colours.

HTML5 / PLAYABLE DEMO

08 / 08 CLAW / BATTLE

Claw Master

The scenario combines a claw machine, weapon merging and enemy-wave battles. The player positions a claw over a pile of items in the lower half of the screen, while the hero and enemies are visible above. After grabbing items, a merging stage turns two weapons into an upgraded option before the battle.

The mechanic

Aim a claw, grab items, merge matching weapons and prepare the hero for combat.

The gameplay loop

Position the claw → grab items → merge weapons → equip the hero and enter battle.

The interaction focus

The grabbing area and combat scene share the same progression. Drag-and-drop in the merging panel visibly turns two items into an upgraded weapon.

ABOUT ME

Alexander Smozhankov

PLAYABLE ADS DEVELOPER

At Studio Cation, my work connected gameplay development with visual production and asset preparation for 2D and 3D playables.

I think about mechanics, visuals and controls as one system. My project work has involved independent decisions across those areas, as well as preparing and processing project assets. My core stack is PixiJS and Three.js, with additional experience in Photoshop, Blender and Spine 2D.

I have actively used AI in my recent project work.

I have created work for AZUR GAMES, GLERA GAMES, VIZOR, ROYAL ARK, MELSOFT and other companies.
